Nucleic acid encoding starch synthase enzyme of maize.

Claim 1; Page 104-107; 138pp; English

This is the nucleotide sequence of the maize gene dull1 (du1). To tagging strates was used to isolate the gene and describe its a transposon tagging stratesy was used to isolate the gene and describe its properties product. The invention reports tagging of the du1 locus with whitensposon, cloning and characterisation of a portion of the gene, and isolation a near full-length cDNA (the present sequence). The amino acid sequence (see AAYO6199) deduced from this cDNA indicates that Du1 codes of SIII. Its expression pattern indicates that Du1 codes for SIII. Its expression pattern indicates that Du1 codes for SIII its expression pattern indicates that Du1 codes for SIII its expression pattern indicates that Du1 codes for SIII of maize endosperm. The Du1 product contains unique sequence features in its N-biosynthetic enzymes. Mutations within the maize SIII gene affect multiple aspects of starch biogenesis by disrupting an enzyme complex containing starch synthace(s), starch branching enzyme(s) and possibly starch debranching enzyme(s). The isolated cDNA can be used to provide an enzyme with which to regulate the production of starch, and with which to regulate the production of starch, and with which to produce altered or novel forms of starch, e.g. in transgenic plants. Expression of Du1 in bacteria and yeasts also modifies glycogen production. Claimed expression vectors comprise the cDNA or fragments of it that code for functional portions of DU1.

The invention describes an isolated DNA molecule encoding a fusion protein consisting of 4 different functional domains selected from glucan association domain (GLASS), linker dunctional domains selected from glucan association domain (GLASS), linker dunctional consisting of the cerminal end (CTEND) which are operably linked to domain (GLYRR), and C-terminal end (CTEND) which are operably linked to one another. The DNA molecule is useful for expressing in plants of moluding starch and modified catalytic capabilities and to improved affinity to starch and modified catalytic organilities and to the in vivo and in vitro synthesis of glucan chains of modified lengths as compared to plants producing native starch produced with cative starch synthases. Expression of the starch synthase fusion proteins along with granule bound starch synthase (GBSS) will lead to a modified starch having an altered or improved morphology, retrogradation, waterbinding, or swelling potential of the granules, gel strength, adhesiveness, cohesiveness, hardness, elasticity, increased or decreased con decreased glucan chain lengths. This sequence concodes a starch synthase used in the invention
                                                                                                     domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New DNA encoding fusion protein consisting of 4 different functional domains selected from glucan association domain, linker domain, glucosyl transferase domain, and C-terminal end, useful for producing modified

The proteins are wheat starch synthases, designated SSII and SSIII. These can be used in the modification of plant starch content or composition, and to screen plants to identify mutations which affect starch content and composition. The starch can then be used in food products, such as flour, and in films, coatings, adhesives, building

The present invention relates to a method (MI) for identifying genes involved in plant resistance or response to pathogenic infection. MI comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an unifected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.

S

pathogenic infection for conferring resistance or tolerance to a bacterial, fungal or viral infection by determining or detecting gene expression.

response of a plant of ing plant Identifying at least one gene involved in plant resistance or respathogenic infection for conferring resistance or tolerance to a bacterial, fungal or viral infection by determining or detecting expression.

t t

Claim 6; SEQ ID NO 4057; 899pp; English

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fundal or viral infection. The present sequence was used to invention illustrate the

This invention, in the area of plant biotechnology, relates to novel polynucleotides comprising a nucleotide sequence encoding a protein which is involved in or associated with the synthesis, metabolism or degradation of carbohydrates in the plant grain and the expression of which is up-regulated during grain filling. The plant is selected from corn, tomato, banana, canola, cotton, peanut, sorghum, tobacco, sugarbeet, what, and rice. The invention may be useful for the cereal grains. In addition, carbohydrate levels may be modified to a more desirable level using the present invention. The present sequence is a more data for this patent did not form part of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formed directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          562

This invention describes a novel nucleic acid (1) encoding a protein (11), or its active fragments, with starch synthase (SS) activity encoding a 1170 residue amino acid sequence (SS), comprising a 1121 base encoding a 1170 residue amino acid sequence (SS), comprising a 121 base pair sequence (SI), both fully defined in the specification, or its complement, or containing the coding region of the cDNA insert in plasmid (R65/87 (DSM 12970) or its complement. The invention also describes (1) vector containing (1) (1), (2) host cell, or transgenic plant cell, that contains (I) or the vector of (1), or is derived from such a cell; (3) (II), or its active fragments, encoded by (I); (4) production of (II), or its active fragments, encoded by (I); (5) plant containing cransgenic cells of (2), and their replicative material; (6) production of the plants of (5); (7) starch produced by the plant cells of (2) or the plants of (5), or their replicative material; and (8) production of modified starch by extraction from the plant cells of (2) or the plants
                                                                                                            2535
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding a starch synthase isoform from maize, used to
produce recombinant plants that produce starch with modified properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    synthesis; starch synthase; maize; transgenic plant; nutrition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             720
of (5), or their starch-storing parts. (I) is used to prepare transgenic plants (specifically maize) that have reduced or increased SS activity, resulting in formation of starch with different chemical and/or physical, and functional, properties, particularly altered viscosity and gelforming properties. Fragments of (I) can also be used as probes to isolate related sequences from other organisms, also as attisense inhibitors of SS activity. The starch produced by the transgenic plants is useful for all usual nutritional and non-nutritional applications. Modified starch may be better suited to particular applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TGGACTGGGTTTTTGCTGACGGCCCACCAGGGAGTGCAAGGAATTATGACAACAATGGAG

                                                                                                                                                                                                                                                                                                                                                           A composite cDNA sequence (AAMT68646) codes for a a 100-140 kDa potato soluble starch synthase (AAW17785). The sequence was deduced from 2 overlapping cDNA clones obtd. from a tuber cDNA library by immunoscreening with antiserum raised against purified starch synthase. Starch synthase nucleic acids can be linked to a plant promoter, in sense or antisense direction, and used to alter starch characteristics in transgenic plants, esp. potato, tomato, rice, wheat, peal cassava, sweet potato, barley, oar or maize. A novel altered starch, extracted from such transgenic plants, has a viscosity onset temperature that is reduced by at least 5 degc compared to starch from non-transformed plants. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               481
